
ASO Risks, Assumptions, and Controls

Risk register, mitigation model, customer-ready implementation checklist, governance cadence, and operating controls.

GitHub path: docs/risks/ASO_Risks_Assumptions_and_Controls.md

Version 1.1 - public customer-ready split package - refined for readability and GitHub publishing

Safety note: this public reference pack must not contain tenant IDs, credentials, secrets, real customer data, private endpoints, or connection strings.

Risks, assumptions, and control model

This document gives the project team a public-safe risk register and mitigation model. It converts the architecture boundaries into controls that can be reviewed during customer conversations and implementation checkpoints.

Risk register

Risk	Impact	Mitigation	Control evidence
Schema names created incorrectly	Flows, integrations, reports, tests, and documentation may bind to wrong names.	Naming gate before creation; delete/recreate before dependencies exist.	Schema contract table and review sign-off.
Default environment used for ASO	ALM confusion, unmanaged components, poor supportability.	Use only Phoenicarix-Sales for build; default environment is not used.	Solution screenshots and repo decision log.
Customer emails sent via Outlook/Power Automate	Compliance and consent breach.	CIJ is the only outbound lifecycle communication layer.	Journey catalogue and flow design review.
Direct SAP access	Security, audit, and idempotency risk.	SAP only through APIM + Azure Functions.	APIM policy and wrapper test evidence.
HubSpot implemented too early	Breaks delivery order and data control.	HubSpot last; Dataverse truth after ingress.	Architecture checkpoint before HubSpot phase.
Personal connections treated as production-ready	Operational ownership and access risk.	Use connection references and service ownership model.	Connection inventory and deployment review.
No correlation IDs	Difficult support and incident triage.	Mandatory message_id, correlation_id, trace_id.	Run log validation and monitoring alerts.
Sales AI treated as final authority	Unreviewed recommendations may drive risky actions.	Sales agents are advisory; Foundry validates; humans approve high-impact actions.	Safety policy tests and review tasks.

Control principles

- Every high-impact commercial action must pass through seller or manager approval.
- Every external call must carry message_id, correlation_id, and trace_id where supported.
- Every customer lifecycle communication must execute through Customer Insights - Journeys.
- Every SAP read/write path must be mediated through APIM and Azure Functions.
- Every schema name is reviewed before creation and frozen after dependencies exist.
- Every flow must be solution-aware, use connection references, use environment variables, and write diagnostic logs.

Customer-ready implementation checklist

Checkpoint	Required evidence
Architecture boundaries approved	HubSpot ingress only, Dataverse operational truth, Customer Insights only sends, Foundry orchestrates, Power Automate executes, SAP via APIM/Functions.

Checkpoint	Required evidence
Naming standard approved	Schema names, variables, choices, flows, views, Azure resources, journeys, agents, and APIs use the standard.
Phase 1 complete	Publisher, solutions, environment variables, connection references, control notes, and trial constraints validated.
Dataverse schema complete	Global choices, Lead/Opportunity/Account/Contact extensions, custom log/ledger tables, keys, duplicate detection.
Sales workspace complete	Forms, tabs, sections, views, roles, field-level security and seller experience validated.
Customer Insights plane ready	Compliance profile, domain, triggers, segments, emails, journeys, consent writeback and ledger configured.
SAP boundary ready	Azure resources, APIM, Functions, Key Vault, SAP wrapper, endpoints, idempotency, telemetry and API tests complete.
Sales AI agents ready	Sales Qualification and Opportunity/Deal Close agents configured in governed mode and tested.
Foundry ready	Parent orchestrator, child agents, canonical schemas, tool controls, safety policy, evaluation datasets validated.
Power Automate ready	Solution-aware flows, env variables, connection references, scopes, retries, logs, approvals tested.
Operations ready	Dashboards, alerts, SLAs, runbooks, support roles, replay process, incident response ready.
E2E tests passed without HubSpot	Lead, SAP context, opportunity risk, approval/SAP submit, disagreement safety tests passed.
HubSpot last	Ingress mapping tested only after core ASO path is stable.

Operating review cadence

Cadence	Attendees	Purpose	Outputs
Weekly operations review	Ops Lead, Power Platform Lead, CRM Architect, AI Architect	Review failures, risks, blockers, and runbook gaps.	Action log, blocker status, incident follow-ups.
Monthly architecture review	Solution Architect, CRM, AI, Integration, Security, Marketing Ops	Approve design changes, standards, and exceptions.	Decision log, updated architecture notes.
Quarterly strategy review	Executive sponsor, platform owner, stream leads	Assess roadmap, value, KPIs, and scaling decisions.	Roadmap changes, funding decisions, governance maturity plan.
